

IBMCNX Scripting Documentation

Christoph Stöttner

E-mail: christoph.stoettner@stoeps.de

Blog: <http://www.stoeps.de>

Abstract

This document is the main documentation of the `ibmcnxscripting` project. You find tips around `jython` and how you can create your own scripts for IBM® Connections and IBM® WebSphere® Application Server Administration.

Contents

1	Jython	1
1.1	Learning Resources	1
1.1.1	Online materials	1
1.1.2	Books	1
1.2	Language elements	1
1.2.1	Comments	2
1.2.2	Variables	2
1.2.3	Ranges	2
1.2.4	Lists	3
1.2.5	Dictionaries	3
1.2.6	if - elif - else	3
1.2.7	Errorhandling	4
2	WebSphere Application Server	4
2.1	Console Preferences	4
2.2	wsadmin	4
2.2.1	Start wsadmin	4
2.2.2	wsadmin set jython as default language	4
2.3	Wsadmin commands	5
2.3.1	AdminApp Object	5
2.3.2	AdminConfig	6
3	IBM Connections wsadmin commands	8
3.1	Load all administrative commands on startup	8
A	Linux Bash Goodies	8
A.1	.bashrc	9

1 Jython

Jython is the Java implementation of Python. I think it is easy to learn and very powerful!

Jython and Python are interpreting languages and you can test your code in the Jython console or wsadmin. Start Jython and type your code, easy to test and you will get fast results.

There are some good online resources and books to learn the basics of Jython or Python:

1.1 Learning Resources

1.1.1 Online materials

Online Learning (Python) You can use Python learning materials for your first steps! It is very similar to learn Jython.

- <http://www.codecademy.com/>
- <http://learnpythonthehardway.org/book/>

Reference

- <http://www.jython.org/jythonbook/en/1.0/>
- <http://www.jython.org/docs/index.html>

1.1.2 Books

WebSphere Application Server Administration Using Jython (2009)
Authors: Robert A. Gibson, Arthur Kevin McGrath and Noel J. Bergman

The Definitive Guide to Jython: Python for the Java Platform (2010)
Authors: Josh Juneau, Frank Wierzbicki, Leo Soto and Victor Ng

1.2 Language elements

Grouping in Jython is done with an indentation of four spaces! Please do not use tab, because i had several issues with code errors on Windows, when i

have used tab grouping.

1.2.1 Comments

Comments in Jython start with `#` and all text after this sign will be ignored!

1.2.2 Variables

```
# Defining a String
x = 'Hello_World'
x = "Hello_World_Two"
```

```
# Defining an integer
y = 10
```

```
# Float
z = 8.75
```

```
# Complex
i = 1 + 8.07j
```

```
# Multiple assignment
x, y, z = 1, 2, 3
```

1.2.3 Ranges

```
wsadmin>range(7)
[0, 1, 2, 3, 4, 5, 6]
```

```
# Include a step in the range
wsadmin>range(0,10,3)
[0, 3, 6, 9]
```

```
# Good base for loops
wsadmin>range(1,11)
[1, 2, 3, 4, 5, 6, 7, 8, 9, 10]
```

```
wsadmin>range(20,27)
[20, 21, 22, 23, 24, 25, 26]
```

1.2.4 Lists

```
#List
wsadmin>dbs = [ 'activities', 'blogs', 'communities', 'dogear' ]
wsadmin>dbs[1]
'blogs'
```

1.2.5 Dictionaries

```
# Dictionary with Performance Data
wsadmin>minConnections = { 'activities':1, 'blogs':1 }
wsadmin>maxConnections = { 'activities':50, 'blogs':250 }
wsadmin>maxConnections
{ 'activities': 50, 'blogs': 250 }
wsadmin>maxConnections.keys()
[ 'activities', 'blogs' ]
wsadmin>maxConnections.values()
[50, 250]
wsadmin>maxConnections[ 'blogs' ]
250
```

1.2.6 if - elif - else

Remember: Grouping of elements is done with an indent of 4 spaces!

```
# Basic
if condition :
    # print or do something
elif other condition :
    # print or do something other
else :
    # print or do completely different

# Example
if value.find( 'CLFWY0217E' ) > -1 :
    print "\t\tuser_already_converted"
elif value.find( 'CLFWY0212E' ) > -1 :
    print "\t\tuser_not_found_in_database"
elif value.find( 'CLFWY0209E' ) > -1 :
    print "\t\tnew_identifier_" + data[1] + "_does_not_exist."
else :
    print "\t\tException_value:_ " + value
```

1.2.7 Errorhandling

You can catch errors with try and except.

```
try:
    # perform some commands which can raise an exception
except Exception, value:
    # perform exception handling
finally:
    # perform task which must always be completed
```

2 WebSphere Application Server

After installing IBM Connections lots of configuration must be done through ISC (Integrated Solution Console). ISC is a good GUI with lots menus and sometimes long click paths. Configuration is possible through **wsadmin** too, but it is hard to find the necessary commands.

2.1 Console Preferences

2.2 wsadmin

Long casesensitiv commands with mostly casesensitiv parameters. Hard to remember and on Linux[®] no history to recall commands.

Always start **wsadmin** in WAS_HOME/profiles/Dmgr01/bin!

2.2.1 Start wsadmin

Windows[®]: `wsadmin.bat -lang jython -username wasadmin -password password`

Linux and AIX[®]: `./wsadmin.sh -lang jython -username wasadmin -password password`

2.2.2 wsadmin set jython as default language

You can set the default language which is used with **wsadmin**, so you can save some character in typing.

```
edit WASHOME/profiles/Dmgr01/properties/wsadmin.properties
```

Default: `com.ibm.ws.scripting.defaultLang=JACL`

Set Jython: `com.ibm.ws.scripting.defaultLang=jython`

2.3 Wsadmin commands

There are five management objects within wsadmin. These objects group the commands to the different MBean Servers.

- AdminConfig
- AdminApp
- AdminTask
- AdminControl
- Help

2.3.1 AdminApp Object

Use the AdminApp object to

- Installing and uninstalling applications
- Listing applications
- Editing applications or modules

Examples

- List of all applications
 - **print** AdminApp.list()
 - AdminApp.list()
 - list =AdminApp.list().split('\n')
- Change options of applications
 - AdminApp.edit('appname',['options'])

2.3.2 AdminConfig

- manage the configuration information that is stored in the repository
- Example change min- and maxConnections of the DataSource Blogs

```

wsadmin>AdminConfig.getid('/DataSource:blogs/')
'blogs(cells/cnxwas1Cell01|resources.xml#DataSource_1371479885975)'
wsadmin>dataSource=AdminConfig.getid('/DataSource:blogs/')
wsadmin>print AdminConfig.show(dataSource1)
[authDataAlias blogsJAASAuth]
[authMechanismPreference BASICPASSWORD]
[connectionPool (cells/cnxwas1Cell01|resources.xml#ConnectionPool_1384252180672)]
[datasourceHelperClassName com.ibm.websphere.rsadapter.DB2UniversalDataStoreHelper]
[description "Blogs_DB2_DataSource"]
[...]
[jndiName jdbc/rollerdb]
[name blogs]
[...]
[provider blogsJDBC(cells/cnxwas1Cell01|resources.xml#JDBCProvider_1371479882710)]
[providerType "DB2_Universal_JDBC_Driver_Provider"]
[statementCacheSize 100]
wsadmin>AdminConfig.modify(dataSource1, [[statementCacheSize_50]])
,,
wsadmin>AdminConfig.modify(dataSource1, [[connectionPool_1[[minConnections_10]
_,_,_,[[maxConnections_100]]]])
,,
wsadmin>AdminConfig.save()
,,

```

3 IBM Connections wsadmin commands

Each application need its own commands:

```
execfile("connectionsConfig.py")
execfile("activitiesAdmin.py")
...
```

3.1 Load all administrative commands on startup

Please be careful, when you use this tip, because in multicluster environments, each `execfile("appNameAdmin.py")` will ask you to select a node, where it will run.

You can create a script with all commands for preloading:

`loadAll.py`:

```
execfile('connectionsConfig.py')
execfile("activitiesAdmin.py")
execfile("blogsAdmin.py")
execfile("communitiesAdmin.py")
execfile("dogearAdmin.py")
execfile("filesAdmin.py")
execfile("forumsAdmin.py")
execfile("homepageAdmin.py")
execfile("newsAdmin.py")
execfile("profilesAdmin.py")
execfile("wikisAdmin.py")
```

Load this script at wsadmin startup:

```
./wsadmin.sh -lang jython -profile loadAll.py
```

A Linux Bash Goodies

A.1 .bashrc

```
# Insert ulimit for file limit
ulimit -n 64000
# set WASHOME
export WASHOME=/opt/IBM/WebSphere/AppServer
# set profileNames
dmgrProfile=Dmgr01
appSrvProfile=AppSrv01
alias dmgrBin='cd $WASHOME/profiles/$dmgrProfile/bin'
alias wsadmin='cd $WASHOME/profiles/$dmgrProfile/bin;./wsadmin.sh_-lang_jython'
alias nodeBin='cd $WASHOME/profiles/$appSrvProfile/bin'
alias startNode='$WASHOME/profiles/$appSrvProfile/bin/startNode.sh'
alias startDmgr='$WASHOME/bin/startManager.sh'
alias stopNode='$WASHOME/profiles/$appSrvProfile/bin/stopNode.sh'
alias stopDmgr='$WASHOME/bin/stopManager.sh'
alias nodeLog='tail -f $WASHOME/profiles/$appSrvProfile/logs/nodeagent/SystemOut.log'
alias InfraLog='tail -f $WASHOME/profiles/$appSrvProfile/logs/InfraCluster_server1/SystemOut.log'
alias Cluster1Log='tail -f $WASHOME/profiles/$appSrvProfile/logs/Cluster1_server1/SystemOut.log'
alias Cluster2Log='tail -f $WASHOME/profiles/$appSrvProfile/logs/Cluster2_server1/SystemOut.log'
```
